

Edwards Manufacturing has been involved in high purity water applications for over 10 years, as a distributor and service company for Reverse Osmosis/De-ionized Water pumps. In that time our technicians have developed the expertise to accurately diagnose and fix RO/DI pump problems.

Our capabilities include complete machining and testing, flush with 18 meg-ohm DI water, high purity nitrogen dry and double bagging in our Class 1000 Clean Room, built specifically for high purity pump repair.

In addition, we have expertise in torpedo pump repair, having developed processes and tooling to handle these highly specialized pumps and assure good quality every time.

From crating and handling to inspection, our ISO certified quality approach assures proper fits, sealing and electrical connections. We have diagnosed and solved problems ranging from improper motor selection, non-compatible bearing lubricants (which will plug RO filters), pump/motor/can alignments and numerous others that will affect your operation, overall cost and Mean Time Between Failure (MTBF). We work with the pump manufacturers to get engineering support and assistance.

We have the capability of providing your new ultra pure water pumps cleaned and bagged. Edwards Manufacturing can source and sell stainless steel centrifugal pumps and cleanse them of the normal cutting oils and other material normally found in industrial grade pumps. You receive a pump ready to fit into your high purity system. (Consult EMI for available pumps & sizes)

Every repair is recorded by pump serial number and kept in our database. Each pump is performance tested and a full test report is sent with every repair. We work with you to lower your maintenance and operating costs by checking all repair records on each pump prior to repair, to catch trends or repeat problems.

Call today for more information on our RO/DI Pump sales & service or check our website at www.edwardsmfg.com.
